Kernel Comparison

FreeBSD vs Linux vs Minix

Scott Barry

Minix is the least LoC , easily the most stable one and uses Ram Disk on a Do While Loop to run it's own drivers including the Sound Card Drivers …
FreeBSD of Clang Compiler is the most LoC, the least stable and gives you the Beep of Death …
Linux is in between Minix and FreeBSD on LoC and is by far the most fully featured one and they make it so easy to spoof the Mac Address on this one …
Linux uses GCC Compiler and generally has less software bugs and Mounts/Unmounts USB without the Kernel Panics or Beep of death that Clang Compiler FreeBSD has …
GCC Is Currently Faster Than LLVM's Clang At Compiling The Linux Kernel So Linux of GCC Compiler is the clear winner also Clang Compiler FreeBSD has More LoC , takes longer to load programs , gives you the BEEP of death Kernel Panic when rapidly mounting USB Drives , Benchmarks from Phronix clearly show GCC is better than Clang and FreeBSD is still lacking also many CVE security vulnerabilities still remained unpatched after several months with BSD …
Minix being the most stable one is also not as user friendly as Linux to set up …
So Linux will be middle ground to FreeBSD and Minix …
Minix = Least LoC = Sound Card Drivers on Ram Disk = Do While Loop for Drivers …
We still are using Hybrid Kernel Windows on most Government Machines …
One other thing that gets me is IPtables CVE Flaws in Linux , Minix has Pfsense for
that same reason, Minix being the clear winner, Redox OS is just Experimental …
I just want convenience, I'll go with Gentoo Linux, can go in to network settings,
Set a DNS and Mac Address or Random Mac Address, the only good security audit I know of is to chmod -R 000 su sudo sudoedit gksudo and doas and that will work to stop any remote root attempts at hacking the system …

You then type : su / date | base64 / passwd root usr and include the "=" sign in passwd …

So now the Newer Releases of Linux's GCC are now more efficient than Clang why would I bother with a Buggy FreeBSD system that kernel panics when rapidly mounting drives, the sound manager crashes, ZFS/UFS are not as stable and often are prone to corruption, I have easily lost data on UFS/ZFS and never on ext4 / reiser / fat32 / ntfs …

As biased as that sounds I still think I have the first amendment to say that …

Commies still run Big Tech and Censor even Superficial Things such as that …

If I just want Lame MP3 out of the box in FFMPEG I go with Gentoo Linux …

The New GhostBSD requires 4+ GB of Ram and so many BSD users are on suckless

or Rat Poison Desktop for that same reason … So it's all a matter of preference …

For instance I do not always pay for Internet, I crack it with f4f4f4f4f4f4 Spoofed Mac Address and a special spot … To do this effectively I need Linux or a Linux Distro …

I could compile a BSD Distro , I just don't feel the need to do so …

There are so many Linux Distros then there is Nomad BSD, PC BSD, Desktop BSD, and Ghost BSD, and when it comes down to it Calculate Linux , Manjaro Linux, Puppy Linux, Slitaz Linux, Kubuntu Linux, Artix Linux, Trisquel are the only good ethical Linux Distros I will stick to that can what : Spoof the Mac Address to crack WiFi and get me Online …

Based on my budget I can only afford : IBM Lenovo : T400/T420/T61/T60/X200/X201

MSI Wind / Dell Inspiron 11 / Intel NUC Mini PC $100 / Eee PC 900A/1005HAB …

For a Music Player I use a crappy Sony ICD-PX470/370 and Sennheiser HD1's …

FreeBSD is also a Proprietary Licence , Linux and GNU are Official Copyleft …

Minix is BSD so it is also a Proprietary Licence , also Berkeley is Jewish , Jewish Means Proprietary in so many ways … Pardon my Political Incorrectness …

Richard Stallman of GNU / Linux openly is against making Israel a Nation State and is for Free Palestine and the BDS Boycott Movement of Puma and other Companies …

Richard Stallman is an alt Jew and non-zionist Jew, other Jews you will find are Country Clubbers and Zionists aka Globalists and we know it's a Jew World Order …

Hitler actually got Germany out of a Banking Debt and printed their own money supply so everything taught by the Victors in history is all BS including the Holocaust Myth …

When will this shit ever end, the Jews have taken over every part of Computers …

A BSD licence is Proprietary a GNU is NOT and is Actually Copyleft …

Minix and FreeBSD are both BSD and Proprietary …

Then they go as far as to backdoor a Minix CPU called x86x64 or 32 and 64 Bit …

This includes all major Intel and AMD systems are Back-doored and hackable …

So many say : If you are not on arm or mips you are doing it wrong (makes sense) …

I think that is about it for this senseless ramble Linux is clearly Copyleft Derp Derp …

The Magic Mac Address is : f4:f4:f4:f4:f4:f4
The Magic DNS is : 45.60.1.1
